Server-Side Rendering (SSR), Loading the Entire Page

- ▶ Traditionally, an **entire page is loaded** when the user clicks a link or a button, which means **all HTML** in the page is read from the server.

Repetition: The MVVM Pattern

- The philosophy behind Model-View-ViewModel, MVVM, is to send **only state changes** from server to client.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

Repetition: The MVVM Pattern

- ▶ The philosophy behind Model-View-ViewModel, MVVM, is to send **only state changes** from server to client.
- ▶ State changes, which means new data, are **stored in the viewmodel**.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

Repetition: The MVVM Pattern

- ▶ The philosophy behind Model-View-ViewModel, MVVM, is to send **only state changes** from server to client.
- ▶ State changes, which means new data, are **stored in the viewmodel**.
- ▶ Therefore, the viewmodel will always contain the **current state** of the application.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

Repetition: The MVVM Pattern

- ▶ The philosophy behind Model-View-ViewModel, MVVM, is to send **only state changes** from server to client.
- ▶ State changes, which means new data, are **stored in the viewmodel**.
- ▶ Therefore, the viewmodel will always contain the **current state** of the application.
- ▶ The browser view will **reflect the viewmodel** state, using the observer pattern.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

Repetition: The MVVM Pattern

- ▶ The philosophy behind Model-View-ViewModel, MVVM, is to send **only state changes** from server to client.
- ▶ State changes, which means new data, are **stored in the viewmodel**.
- ▶ Therefore, the viewmodel will always contain the **current state** of the application.
- ▶ The browser view will **reflect the viewmodel** state, using the observer pattern.
- ▶ This is very useful for a CSR application.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

AJAX: To Load Only Data

- ▶ The dominating method to request data from the server, **without reloading** the web page, is **A**synchronous **J**avaScript **A**nd **X**ML, **AJAX**.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

AJAX: To Load Only Data

- ▶ The dominating method to request data from the server, **without reloading** the web page, is **A**synchronous **J**avaScript **A**nd **X**ML, **AJAX**.
- ▶ AJAX is basically a way to use **existing technologies**, such as JavaScript, HTTP and XML.
 - ▶ No new language or markup.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

Addressable resources

- ▶ A resource is **any abstraction handled by the application**, for example a message or a user in a chat program.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

Addressable resources

- ▶ A resource is **any abstraction handled by the application**, for example a message or a user in a chat program.
- ▶ Each resource must be addressable via a URI, which in the case of a web application means it must be **reachable at a URL**.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

Addressable resources

- ▶ A resource is **any abstraction handled by the application**, for example a message or a user in a chat program.
- ▶ Each resource must be addressable via a URI, which in the case of a web application means it must be **reachable at a URL**.
- ▶ This **makes all resources linkable**, references to resources can be embedded in for example documents or emails.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

Addressable Resources, Contd

An example JSON document representing chat messages:

```
{
  "success": [
    {
      "id": 1,
      "msg": "hi Stina",
      "deletedAt": null,
      "author": "http://localhost:7777/user/2"
    },
    {
      "id": 2,
      "msg": "hi Nisse",
      "deletedAt": null,
      "author": "http://localhost:7777/user/1"
    }
  ]
}
```

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

A Uniform, Constrained Interface

Architecture

Representation-Oriented

- ▶ Client and server exchange representations of the resource identified by the URL, the **entire representation, *object*, is transferred in each message.**

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

Representation-Oriented

- ▶ Client and server exchange representations of the resource identified by the URL, the **entire representation, *object*, is transferred in each message.**
- ▶ The representation is in the HTTP body, the format could be for example JSON.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

Representation-Oriented

- ▶ Client and server exchange representations of the resource identified by the URL, the **entire representation, *object*, is transferred in each message.**
- ▶ The representation is in the HTTP body, the format could be for example JSON.
- ▶ The format is specified with the content-type HTTP header, for example `application/json`.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

Representation-Oriented

- ▶ Client and server exchange representations of the resource identified by the URL, the **entire representation, *object*, is transferred in each message.**
- ▶ The representation is in the HTTP body, the format could be for example JSON.
- ▶ The format is specified with the content-type HTTP header, for example `application/json`.
- ▶ Different clients can use different formats.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

Stateless Communication

- ▶ No client session data stored on the server, all data needed to handle a request must be included in the request.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

Stateless Communication

- ▶ No client session data stored on the server, all data needed to handle a request must be included in the request.
- ▶ Means that, if the application has more than one server, any server can serve any request from any client.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

Hypermedia as the Engine of Application State, HATEOAS

- ▶ Since all resources are addressable, links to them can be embedded in representations, see the example on the Addressable Resources slide above.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

Hypermedia as the Engine of Application State, HATEOAS

- ▶ Since all resources are addressable, links to them can be embedded in representations, see the example on the Addressable Resources slide above.
- ▶ This, together with the Constrained Interface and Representation-Oriented principles, leads to **object graphs in message bodies**.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

HATEOAS, Cont'd

- ▶ Consider an HTTP body consisting of a chat message:

```
{  
  "id": 1,  
  "msg": "hi Stina",  
  "deletedAt": null,  
  "author": "http://localhost:7777/user/2"  
},
```

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

HATEOAS, Cont'd

- ▶ Consider an HTTP body consisting of a chat message:

```
{  
  "id": 1,  
  "msg": "hi Stina",  
  "deletedAt": null,  
  "author": "http://localhost:7777/user/2"  
},
```

- ▶ The body is an object, delimited by '{' and '}'.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

HATEOAS, Cont'd

- ▶ Consider an HTTP body consisting of a chat message:

```
{  
  "id": 1,  
  "msg": "hi Stina",  
  "deletedAt": null,  
  "author": "http://localhost:7777/user/2"  
},
```

- ▶ The body is an object, delimited by '{' and '}'.
- ▶ The object has four attributes, **id**, **msg**, **deletedAt** and **author**.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

HATEOAS, Cont'd

- ▶ Consider an HTTP body consisting of a chat message:

```
{  
  "id": 1,  
  "msg": "hi Stina",  
  "deletedAt": null,  
  "author": "http://localhost:7777/user/2"  
},
```

- ▶ The body is an object, delimited by '{' and '}'.
- ▶ The object has four attributes, **id**, **msg**, **deletedAt** and **author**.
- ▶ The value of the attribute **author** is a reference to another object.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

HATEOAS, Cont'd

- ▶ Consider an HTTP body consisting of a chat message:

```
{  
  "id": 1,  
  "msg": "hi Stina",  
  "deletedAt": null,  
  "author": "http://localhost:7777/user/2"  
},
```

- ▶ The body is an object, delimited by '{' and '}'.
- ▶ The object has four attributes, **id**, **msg**, **deletedAt** and **author**.
- ▶ The value of the attribute **author** is a reference to another object.
- ▶ All objects have the methods **get**, **post**, **put** and **delete**.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

HATEOAS, Cont'd

- ▶ Consider an HTTP body consisting of a chat message:

```
{  
  "id": 1,  
  "msg": "hi Stina",  
  "deletedAt": null,  
  "author": "http://localhost:7777/user/2"  
},
```

- ▶ The body is an object, delimited by '{' and '}'.
 - ▶ The object has four attributes, **id**, **msg**, **deletedAt** and **author**.
 - ▶ The value of the attribute **author** is a reference to another object.
 - ▶ All objects have the methods **get**, **post**, **put** and **delete**.
- ▶ This is **object-oriented HTTP**.

Architecture

We Always Need a Framework!

- ▶ Remember that our goal is to **only write application specific code**.
- ▶ But a web application contains a lot of code that is not application specific (infrastructure code).
 - ▶ **Map** an HTTP request to a JavaScript method handling that request.
 - ▶ Send **exceptions** to error handling methods.
 - ▶ Serve **static files** (html, css, images, etc).
 - ▶ Make **security** checks, for example if the user is logged in, before handling a request.
- ▶ Thus, it is **mandatory to use a web application framework** in order to **not write infrastructure code**.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

Why Express.js?

- ▶ **Express.js** is a web application framework for node.js.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

Why Express.js?

- ▶ [Express.js](#) is a web application framework for node.js.
- ▶ Small, quite easy to understand.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

Why Express.js?

- ▶ [Express.js](#) is a web application framework for node.js.
- ▶ Small, quite easy to understand.
- ▶ Handles the most fundamental web application infrastructure code.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

Why Express.js?

- ▶ **Express.js** is a web application framework for node.js.
- ▶ Small, quite easy to understand.
- ▶ Handles the most fundamental web application infrastructure code.
- ▶ Eliminates a lot of the infrastructure code from applications written in the course.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

Why Express.js?

- ▶ **Express.js** is a web application framework for node.js.
- ▶ Small, quite easy to understand.
- ▶ Handles the most fundamental web application infrastructure code.
- ▶ Eliminates a lot of the infrastructure code from applications written in the course.
- ▶ Very widely used and very actively maintained.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

Install Express

- ▶ Express, like all other node utilities, is installed with npm.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

Install Express

- ▶ Express, like all other node utilities, is installed with npm.
- ▶ Add express to the **dependencies** object in **package.json**

```
"express": "^4.17.1"
```

^4.17.1 means any 4.x version bigger than 4.17.1, which is the current version when this presentation is written.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

Install Express

- ▶ Express, like all other node utilities, is installed with npm.
- ▶ Add express to the **dependencies** object in **package.json**

```
"express": "^4.17.1"
```

^4.17.1 means any 4.x version bigger than 4.17.1, which is the current version when this presentation is written.

- ▶ Install by executing the command **npm install** in the project root, the directory where **package.json** is located.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

The First Express App

```
1  const express = require('express');
2  const app = express();
3  const port = 8001;
4
5  app.get('/', (req, res) =>
6    res.send('Server is up'));
7
8  app.listen(port, () =>
9    console.log(`Server running at ${port}!`));
```

- ▶ Line 1 loads express.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

The First Express App

```
1 const express = require('express');
2 const app = express();
3 const port = 8001;
4
5 app.get('/', (req, res) =>
6   res.send('Server is up'));
7
8 app.listen(port, () =>
9   console.log(`Server running at ${port}!`));
```

- ▶ Line 1 loads express.
- ▶ Line 2 creates an express application.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

The First Express App

```
1 const express = require('express');
2 const app = express();
3 const port = 8001;
4
5 app.get('/', (req, res) =>
6   res.send('Server is up'));
7
8 app.listen(port, () =>
9   console.log(`Server running at ${port}!`));
```

- ▶ Line 1 loads express.
- ▶ Line 2 creates an express application.
- ▶ The call to **app.get** on line 5 tells express that an HTTP GET request to the path / shall execute the callback function
(req, res) =>
res.send('Server is up')

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

The First Express App, Cont'd

```
1 const express = require('express');
2 const app = express();
3 const port = 8001;
4
5 app.get('/', (req, res) =>
6   res.send('Server is up'));
7
8 app.listen(port, () =>
9   console.log(`Server running at ${port}!`));
```

- ▶ Line 6 calls the method **send** in the **res** object.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

The First Express App, Cont'd

```
1 const express = require('express');
2 const app = express();
3 const port = 8001;
4
5 app.get('/', (req, res) =>
6   res.send('Server is up'));
7
8 app.listen(port, () =>
9   console.log(`Server running at ${port}!`));
```

- ▶ Line 6 calls the method **send** in the **res** object.
- ▶ The **res** object represents the HTTP response, the **send** method sends an HTTP response containing only the specified string.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

The First Express App, Cont'd

```
1  const express = require('express');
2  const app = express();
3  const port = 8001;
4
5  app.get('/', (req, res) =>
6    res.send('Server is up'));
7
8  app.listen(port, () =>
9    console.log(`Server running at ${port}!`));
```

- ▶ The call to **app.listen** on line 8 makes the server listen for http requests on the specified port.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

The First Express App, Cont'd

```
1  const express = require('express');
2  const app = express();
3  const port = 8001;
4
5  app.get('/', (req, res) =>
6    res.send('Server is up'));
7
8  app.listen(port, () =>
9    console.log(`Server running at ${port}!`));
```

- ▶ The call to **app.listen** on line 8 makes the server listen for http requests on the specified port.
- ▶ The callback function on line 9 is executed when the server has started.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

A Word About Nodemon

- ▶ **nodemon** is a utility that monitors the files in a web application and restarts the application if any file changes.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

A Word About Nodemon

- ▶ **nodemon** is a utility that monitors the files in a web application and restarts the application if any file changes.
- ▶ In **package.json**, the server is started by executing
`nodemon.js ./scripts/server`
- ▶ Installation is as usual with npm, add nodemon to the dependency section in **package.json** and execute **npm install**.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

The Express Objects

- ▶ The express framework consists of the four objects **application**, **request**, **response** and **router**.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

The Express Objects

- ▶ The express framework consists of the four objects **application**, **request**, **response** and **router**.
 - ▶ [Application](#) represents the entire app, and is used to [route](#) HTTP requests to JavaScript functions.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

The Express Objects

- ▶ The express framework consists of the four objects **application**, **request**, **response** and **router**.
 - ▶ **Application** represents the entire app, and is used to **route** HTTP requests to JavaScript functions.
 - ▶ **Request** represents the HTTP request, and is used to get information about the request.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

The Express Objects

- ▶ The express framework consists of the four objects **application**, **request**, **response** and **router**.
 - ▶ **Application** represents the entire app, and is used to **route** HTTP requests to JavaScript functions.
 - ▶ **Request** represents the HTTP request, and is used to get information about the request.
 - ▶ **Response** represents the HTTP response, and is used to send a response.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

The Express Objects

- ▶ The express framework consists of the four objects **application**, **request**, **response** and **router**.
 - ▶ **Application** represents the entire app, and is used to **route** HTTP requests to JavaScript functions.
 - ▶ **Request** represents the HTTP request, and is used to get information about the request.
 - ▶ **Response** represents the HTTP response, and is used to send a response.
 - ▶ **Router** is like a mini-application, which can contain its own HTTP request to JavaScript function mappings. The entire router object is mapped to a URL by the **application** object.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

The Application Object, Routing

- ▶ We have seen how a HTTP GET was mapped to the root, /, by calling

```
app.get('/', (req, res) => //handle request)
```

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

The **Application** Object, Routing

- ▶ We have seen how a HTTP GET was mapped to the root, /, by calling

```
app.get('/', (req, res) => //handle request)
```

- ▶ Any request using HTTP GET, POST, PUT or DELETE, can be mapped to any URL in the same way.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

The Application Object, Routing

- ▶ We have seen how a HTTP GET was mapped to the root, /, by calling

```
app.get('/', (req, res) => //handle request)
```

- ▶ Any request using HTTP GET, POST, PUT or DELETE, can be mapped to any URL in the same way.
- ▶ For example, a POST request is mapped to the URL /**abc/def** by calling

```
app.post('/abc/def', (req, res) => // ...)
```

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

The **Application** Object, Middleware

- ▶ A **middleware** function performs some action before a request is passed to its request handling function.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

The **Application** Object, Middleware

- ▶ A **middleware** function performs some action before a request is passed to its request handling function.
- ▶ Typically used for **non-functional** requirements, for example logging or security.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

The Application Object, Middleware, Cont'd

```
1 app.use((req, res, next) => {  
2   console.log(  
3     req Date().toLocaleTimeString() + ': ' +  
4     req.method + ' ' + req.originalUrl +  
5     ' from ' + req.ip  
6   );  
7   next();  
8 });
```

- ▶ A middleware function is registered by calling **app.use**. The example above registers a function that logs all HTTP requests.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

The Application Object, Middleware, Cont'd

```
1 app.use((req, res, next) => {  
2   console.log(  
3     req.Date().toLocaleTimeString() + ' : ' +  
4     req.method + ' ' + req.originalUrl +  
5     ' from ' + req.ip  
6   );  
7   next();  
8 });
```

- ▶ A middleware function is registered by calling **app.use**. The example above registers a function that logs all HTTP requests.
- ▶ Note the call to **next()** on line 7. That is when the request handling function (or next middleware function) is invoked.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

The Application Object, Middleware, Cont'd

```
1 app.use((req, res, next) => {  
2   console.log(  
3     req.Date().toLocaleTimeString() + ' : ' +  
4     req.method + ' ' + req.originalUrl +  
5     ' from ' + req.ip  
6   );  
7   next();  
8 });
```

- ▶ A middleware function is registered by calling **app.use**. The example above registers a function that logs all HTTP requests.
- ▶ Note the call to **next()** on line 7. That is when the request handling function (or next middleware function) is invoked.
- ▶ Without a call to **next**, the request handling is terminated when the middleware function returns.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

The **Request** Object, Parameters

- ▶ The **request** object is used to get information about the request.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

The **Request** Object, Parameters

- ▶ The **request** object is used to get information about the request.
- ▶ The logging middleware function above illustrated how to get for example the HTTP method and the URL of the request.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

The **Request** Object, Parameters

- ▶ The **request** object is used to get information about the request.
- ▶ The logging middleware function above illustrated how to get for example the HTTP method and the URL of the request.
- ▶ When writing a REST API, it is common to include a resource id as a part of the URL. An HTTP GET to the URL **/user/2** means to read the user with id 2.
- ▶ To extract such a parameter, the **request** object is used as below.

```
app.get('/user/:id', (req, res) =>
  res.send('The id is ' + req.params.id));
```

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

The **Request** Object, Body

- ▶ When the user is **uploading a new state** of a resource, for example by creating a new message in a chat, that new state might be **in the request body**.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

The **Request** Object, Body

- ▶ When the user is **uploading a new state** of a resource, for example by creating a new message in a chat, that new state might be **in the request body**.
- ▶ Neither node itself, nor express, parses body data. We need an npm package that handles the parsing.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

The **Request** Object, Body

- ▶ When the user is **uploading a new state** of a resource, for example by creating a new message in a chat, that new state might be **in the request body**.
- ▶ Neither node itself, nor express, parses body data. We need an npm package that handles the parsing.
- ▶ The sample application uses the package **body-parser**, as illustrated on the next slide.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

The Request Object, Body, Cont'd

```
1  const bodyParser = require('body-parser');
2  app.use(bodyParser.json());
3
4  app.post('/msg', (req, res) =>
5    res.send('The body is ' + req.body.msg));
```

- ▶ Line one loads the body-parser package.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

The Request Object, Body, Cont'd

```
1  const bodyParser = require('body-parser');
2  app.use(bodyParser.json());
3
4  app.post('/msg', (req, res) =>
5    res.send('The body is ' + req.body.msg));
```

- ▶ Line one loads the body-parser package.
- ▶ Line two registers a middleware function that can parse bodies in JSON format. The parser will add the parsed objects to the express **request** object.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

The Request Object, Body, Cont'd

```
1  const bodyParser = require('body-parser');
2  app.use(bodyParser.json());
3
4  app.post('/msg', (req, res) =>
5    res.send('The body is ' + req.body.msg));
```

- ▶ Line one loads the body-parser package.
- ▶ Line two registers a middleware function that can parse bodies in JSON format. The parser will add the parsed objects to the express **request** object.
- ▶ If the request body contained an variable named **msg**, that object is contained in the parameter **req.body.msg**, on line five.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

The **Response** Object

- ▶ The response object is used to send an HTTP response.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

The Response Object

- ▶ The response object is used to send an HTTP response.
- ▶ As seen in many examples above, the **send** method is used to send a response.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

The Response Object

- ▶ The response object is used to send an HTTP response.
- ▶ As seen in many examples above, the **send** method is used to send a response.
 - ▶ **send** performs many tasks, for example to set the **Content-Length** response header and cache-related headers.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

The Response Object

- ▶ The response object is used to send an HTTP response.
- ▶ As seen in many examples above, the **send** method is used to send a response.
 - ▶ **send** performs many tasks, for example to set the **Content-Length** response header and cache-related headers.
 - ▶ The default status code is 200 (OK).

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

The Response Object

- ▶ The response object is used to send an HTTP response.
- ▶ As seen in many examples above, the **send** method is used to send a response.
 - ▶ **send** performs many tasks, for example to set the **Content-Length** response header and cache-related headers.
 - ▶ The default status code is 200 (OK).
- ▶ The HTTP status code can be changed by calling **res.status**.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

The Response Object

- ▶ The response object is used to send an HTTP response.
- ▶ As seen in many examples above, the **send** method is used to send a response.
 - ▶ **send** performs many tasks, for example to set the **Content-Length** response header and cache-related headers.
 - ▶ The default status code is 200 (OK).
- ▶ The HTTP status code can be changed by calling **res.status**.
- ▶ If the response has no body, terminate the response by calling **end**.

```
app.get('/', //status is 404, body is empty
  (req, res) => res.status(404).end());
app.get('/', //status is 200, body is empty
  (req, res) => res.end());
```

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

The Response Object, Cont'd

- ▶ If the body shall be in **JSON format**, as is normally the case in a REST API, use the method **json** instead of **send**.

```
app.get('/',  
  (req, res) =>  
    res.json({param1: 'abc123'}));
```

- ▶ If the name of a JSON object property can not be hardcoded, use square bracket notation for a **computed property name**.

```
const propName = 'param1';  
app.get('/',  
  (req, res) =>  
    res.json({ [propName]: 'abc123' }));
```

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

The Router Object

```
1  const express = require('express');
2
3  const msgApi = express.Router();
4  msgApi.get('/:id', (req, res) =>
5    res.send('returning msg ' + req.params.id)
6  );
7  msgApi.delete('/:id', (req, res) =>
8    res.send('deleted msg ' + req.params.id)
9  );
10
11 app.use('/msg', msgApi);
```

- ▶ A router can be considered a [mini-application](#), containing only middleware and request handlers.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

The Router Object

```
1  const express = require('express');
2
3  const msgApi = express.Router();
4  msgApi.get('/:id', (req, res) =>
5    res.send('returning msg ' + req.params.id)
6  );
7  msgApi.delete('/:id', (req, res) =>
8    res.send('deleted msg ' + req.params.id)
9  );
10
11 app.use('/msg', msgApi);
```

- ▶ A router can be considered a [mini-application](#), containing only middleware and request handlers.
- ▶ Can make the code easier to read, by grouping related request handlers.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

The Router Object

```
1  const express = require('express');
2
3  const msgApi = express.Router();
4  msgApi.get('/:id', (req, res) =>
5    res.send('returning msg ' + req.params.id)
6  );
7  msgApi.delete('/:id', (req, res) =>
8    res.send('deleted msg ' + req.params.id)
9  );
10
11 app.use('/msg', msgApi);
```

- ▶ A router can be considered a [mini-application](#), containing only middleware and request handlers.
- ▶ Can make the code easier to read, by grouping related request handlers.
- ▶ The example above creates an API for message handling on lines 3-9, and adds the API to the application on line 11.

Architecture

Cookies and REST, Cont'd

- ▶ An often used compromise is to return a **token identifying the user** to a client that has authenticated.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

Cookies and REST, Cont'd

- ▶ An often used compromise is to return a **token identifying the user** to a client that has authenticated.
- ▶ The client must then include that token in the **Authorization HTTP header** of each request.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

Cookies and REST, Cont'd

- ▶ An often used compromise is to return a **token identifying the user** to a client that has authenticated.
- ▶ The client must then include that token in the **Authorization HTTP header** of each request.
- ▶ However, also a cookie is passed as an HTTP request header. Therefore, it is not worse, from a REST point of view, to **pass the token in a cookie**. Using a cookie facilitates client side handling.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

Cookies and REST, Cont'd

- ▶ An often used compromise is to return a **token identifying the user** to a client that has authenticated.
- ▶ The client must then include that token in the **Authorization HTTP header** of each request.
- ▶ However, also a cookie is passed as an HTTP request header. Therefore, it is not worse, from a REST point of view, to **pass the token in a cookie**. Using a cookie facilitates client side handling.
 - ▶ This solution is very common, and is also used in the course.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

Cookies and REST, Cont'd

- ▶ The argument against the solution on the previous slide is that we just **reinvented HTTP sessions**, and had to write the session management ourselves.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

Cookies and REST, Cont'd

- ▶ The argument against the solution on the previous slide is that we just **reinvented HTTP sessions**, and had to write the session management ourselves.
- ▶ In reply, we can claim that we are now free to place the token also in the **Authorization** header, which is required in some cases.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

Cookies and REST, Cont'd

- ▶ The argument against the solution on the previous slide is that we just **reinvented HTTP sessions**, and had to write the session management ourselves.
- ▶ In reply, we can claim that we are now free to place the token also in the **Authorization** header, which is required in some cases.
- ▶ We could also argue that we have better control over the “session” handling, we are for example free to choose format of the token.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

Cookies and REST, Cont'd

- ▶ In reply, we can claim that we are now free to place the token also in the **Authorization** header, which is required in some cases.
- ▶ We could also argue that we have better control over the “session” handling, we are for example free to choose format of the token.
- ▶ And so the debate continues...

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

To Set a Cookie

- ▶ Cookies are **set** with the **cookie** function of the express **response** object. Since cookies are HTTP headers, this function must be called **before any output** is sent.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

To Set a Cookie

- ▶ Cookies are **set** with the **cookie** function of the express **response** object. Since cookies are HTTP headers, this function must be called **before any output** is sent.

```
res.cookie('name', 'value', {expires: 0});
```

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

To Set a Cookie

- ▶ Cookies are **set** with the **cookie** function of the express **response** object. Since cookies are HTTP headers, this function must be called **before any output** is sent.

```
res.cookie('name', 'value', {expires: 0});
```

- ▶ **name** and **value** is the cookie's **name/value pair**.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

To Set a Cookie

- ▶ Cookies are **set** with the **cookie** function of the express **response** object. Since cookies are HTTP headers, this function must be called **before any output** is sent.

```
res.cookie('name', 'value', {expires: 0});
```

- ▶ **name** and **value** is the cookie's **name/value pair**.
- ▶ **expire** tells the **instant in time** when the cookie expires. Setting it to zero creates a **session cookie**, which means it should be discarded when the browser is closed.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

To Set a Cookie

- ▶ Cookies are **set** with the **cookie** function of the express **response** object. Since cookies are HTTP headers, this function must be called **before any output** is sent.

```
res.cookie('name', 'value', {expires: 0});
```

- ▶ **name** and **value** is the cookie's **name/value pair**.
- ▶ **expire** tells the **instant in time** when the cookie expires. Setting it to zero creates a **session cookie**, which means it should be discarded when the browser is closed.
 - ▶ However, web browsers may use **session restoring**, which means session state, including cookies, is not discarded.

- ▶ The following code registers the **cookie-parser** middleware.

```
const cookieParser =  
  require('cookie-parser');  
app.use(cookieParser());
```

- ▶ The following code retrieves the cookies with the name **cookieName**.

```
const theCookie = req.cookies.cookieName;
```

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

Third Party Cookies

- ▶ Cookies set by a server with a domain name **different** from the server's.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

Third Party Cookies

- ▶ Cookies set by a server with a domain name **different** from the server's.
- ▶ If many servers set the same third party cookie, the third party server can **track the user's surfing**.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

Third Party Cookies

- ▶ Cookies set by a server with a domain name **different** from the server's.
- ▶ If many servers set the same third party cookie, the third party server can **track the user's surfing**.
- ▶ Typically used for marketing.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

Third Party Cookies

- ▶ Cookies set by a server with a domain name **different** from the server's.
- ▶ If many servers set the same third party cookie, the third party server can **track the user's surfing**.
- ▶ Typically used for marketing.
- ▶ There are many other ways, beside cookies, to identify a user for tracking purposes.
 - ▶ Flash, Silverlight and HTML5 storages
 - ▶ HTML5 canvas painting
 - ▶ content of caches and cache tags like Last-Modified or ETag
 - ▶ social networks
 - ▶ fingerprinting mechanisms like supported ciphersuites, DNS content, HTTP headers, plugins and fonts, clock drift, CPU and GPU benchmarks, network level information, user behavior

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

The EU Cookie Law

A person shall **not store or gain access to information stored, in the terminal equipment of a subscriber or user** unless the requirements of paragraph (2) are met.

(2) The requirements are that the subscriber or user of that terminal equipment

1. is provided with clear and comprehensive information about the purposes of the storage of, or access to, that information; and
2. has given their consent.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

Exceptions To The Law

- ▶ The cookie is for the sole purpose of carrying out the transmission of a communication over an electronic communications network.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

Exceptions To The Law

- ▶ The cookie is for the sole purpose of carrying out the transmission of a communication over an electronic communications network.
 - ▶ Not relevant here.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

Exceptions To The Law

- ▶ The cookie is for the sole purpose of carrying out the transmission of a communication over an electronic communications network.
 - ▶ Not relevant here.
- ▶ The cookie is strictly necessary for the provision of an information society service requested by the subscriber or user.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

Exceptions To The Law

- ▶ The cookie is for the sole purpose of carrying out the transmission of a communication over an electronic communications network.
 - ▶ Not relevant here.
- ▶ The cookie is strictly necessary for the provision of an information society service requested by the subscriber or user.
 - ▶ Applies to for example shopping baskets and authentication in an internet bank.

Authentication

Scopes

Other Npm Packages

Architecture

Authentication

- ▶ To **Authenticate** means to prove the identity.
- ▶ In this course, it is done by providing **username and password**.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

Authentication

- ▶ To **Authenticate** means to prove the identity.
- ▶ In this course, it is done by providing **username and password**.
- ▶ Other methods are for example a digital certificate or two-factor authentication.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

Authentication

- ▶ To **Authenticate** means to prove the identity.
- ▶ In this course, it is done by providing **username and password**.
- ▶ Other methods are for example a digital certificate or two-factor authentication.
- ▶ Once a user is authenticated, it is necessary to **recognize requests** from that particular user. Otherwise, the user would have to authenticate at each request.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

Authentication

- ▶ To **Authenticate** means to prove the identity.
- ▶ In this course, it is done by providing **username and password**.
- ▶ Other methods are for example a digital certificate or two-factor authentication.
- ▶ Once a user is authenticated, it is necessary to **recognize requests** from that particular user. Otherwise, the user would have to authenticate at each request.
- ▶ Authenticating at each request brings a **security risk**, because then the password must somehow be managed by the client.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

JSON Web Tokens, JWT

- ▶ JSON Web Tokens, JWT, is a standard maintained by the Internet Engineering Task Force (IETF)

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

JSON Web Tokens, JWT

- ▶ JSON Web Tokens, JWT, is a standard maintained by the Internet Engineering Task Force (IETF)
- ▶ A JWT is a signed set of **key-value pairs**.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

JSON Web Tokens, JWT

- ▶ JSON Web Tokens, JWT, is a standard maintained by the Internet Engineering Task Force (IETF)
- ▶ A JWT is a signed set of **key-value pairs**.
- ▶ JWT guarantees **integrity**, the content of a JWT can not be altered without revealing that it is altered.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

JSON Web Tokens, JWT

- ▶ JSON Web Tokens, JWT, is a standard maintained by the Internet Engineering Task Force (IETF)
- ▶ A JWT is a signed set of **key-value pairs**.
- ▶ JWT guarantees **integrity**, the content of a JWT can not be altered without revealing that it is altered.
- ▶ It is common solve the problem of recognizing an authenticated user by placing a **JWT in a cookie**.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

The Anatomy of a JWT

- ▶ A JWT consists of **three parts**, header, payload and signature.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

The Anatomy of a JWT

- ▶ A JWT consists of **three parts**, header, payload and signature.
- ▶ The **header** defines the type (which is JWT) and the algorithm used for signing.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

The Anatomy of a JWT

- ▶ A JWT consists of **three parts**, header, payload and signature.
- ▶ The **header** defines the type (which is JWT) and the algorithm used for signing.
- ▶ The **payload** is the set of key-value pairs containing the JWT's data.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

The Anatomy of a JWT

- ▶ A JWT consists of **three parts**, header, payload and signature.
- ▶ The **header** defines the type (which is JWT) and the algorithm used for signing.
- ▶ The **payload** is the set of key-value pairs containing the JWT's data.
- ▶ The **signature** is computed by a signing algorithm, and is based on the header, the payload, and a secret known only to the issuer and to those verifying the JWT.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

The Anatomy of a JWT

- ▶ A JWT consists of **three parts**, header, payload and signature.
- ▶ The **header** defines the type (which is JWT) and the algorithm used for signing.
- ▶ The **payload** is the set of key-value pairs containing the JWT's data.
- ▶ The **signature** is computed by a signing algorithm, and is based on the header, the payload, and a secret known only to the issuer and to those verifying the JWT.
- ▶ To **verify** that the content of a JWT has not been altered, the signature is re-calculated and compared to the signature in the JWT.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

Registered Claims

- ▶ A key-value pair in the JWT payload is called a **claim**.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

Registered Claims

- ▶ A key-value pair in the JWT payload is called a **claim**.
- ▶ There are some **registered claims**, with reserved names, that are understood by all JWT implementations.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

Registered Claims

- ▶ A key-value pair in the JWT payload is called a **claim**.
- ▶ There are some **registered claims**, with reserved names, that are understood by all JWT implementations.
- ▶ Using the registered claims is optional. The sample chat application uses two, **iat** and **exp**.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

Registered Claims

- ▶ A key-value pair in the JWT payload is called a **claim**.
- ▶ There are some **registered claims**, with reserved names, that are understood by all JWT implementations.
- ▶ Using the registered claims is optional. The sample chat application uses two, **iat** and **exp**.
 - ▶ **iat** means **issued at** and tells when the JWT was created.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

Registered Claims

- ▶ A key-value pair in the JWT payload is called a **claim**.
- ▶ There are some **registered claims**, with reserved names, that are understood by all JWT implementations.
- ▶ Using the registered claims is optional. The sample chat application uses two, **iat** and **exp**.
 - ▶ **iat** means **issued at** and tells when the JWT was created.
 - ▶ **exp** means **expiration time** and defines a time after which the JWT must not be accepted.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

What to Include In the JWT

- ▶ A JWT shall be **self-contained**, meaning it shall contain all required information about the user whose identity it proves.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

What to Include In the JWT

- ▶ A JWT shall be **self-contained**, meaning it shall contain all required information about the user whose identity it proves.
- ▶ In the sample chat application, this is the user's **id and username**.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

To Create a JWT

- ▶ The sample application uses the npm package **jsonwebtoken** to create and verify JWTs.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

To Create a JWT

- ▶ The sample application uses the npm package **jsonwebtoken** to create and verify JWTs.
- ▶ A JWT is created with the **sign** method, as below.

```
const jwt = require('jsonwebtoken');

const jwtToken = jwt.sign(
  {id: user.id, username: user.username},
  'this is the secret used to sign the JWT',
  {
    expiresIn: '30 minutes',
  }
);
```

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

To Read a JWT

- ▶ A JWT is read with the **verify** method, as below.

```
const jwt = require('jsonwebtoken');  
  
const cookieContent = req.cookies.chatAuth;  
const JWTPayload = jwt.verify(  
  cookieContent,  
  'this is the secret used to sign the JWT'  
);
```

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

Is the User Really Logged In?

- ▶ As was seen above, the **expiry time is short**, just 30 minutes. That means the user is logged out every 30 minutes.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

Is the User Really Logged In?

- ▶ As was seen above, the **expiry time is short**, just 30 minutes. That means the user is logged out every 30 minutes.
- ▶ The reason is that the **JWT payload might become invalid**, therefore a new JWT is created each 30 minutes.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

Is the User Really Logged In?

- ▶ As was seen above, the **expiry time is short**, just 30 minutes. That means the user is logged out every 30 minutes.
- ▶ The reason is that the **JWT payload might become invalid**, therefore a new JWT is created each 30 minutes.
- ▶ To relieve the user of having to log in again and again, the user's **real login expiry time is stored in the database**. If the JWT expires, but the logout period in the database has not expired, a new JWT is created without forcing the user to re-login.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

Is the User Really Logged In?

- ▶ As was seen above, the **expiry time is short**, just 30 minutes. That means the user is logged out every 30 minutes.
- ▶ The reason is that the **JWT payload might become invalid**, therefore a new JWT is created each 30 minutes.
- ▶ To relieve the user of having to log in again and again, the user's **real login expiry time is stored in the database**. If the JWT expires, but the logout period in the database has not expired, a new JWT is created without forcing the user to re-login.
- ▶ This also makes it possible to **log out the user programmatically**, by setting the user's database status to **not logged in**.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

But Isn't That an HTTP Session?

- ▶ It can easily be argued, as was done previously, that since we now anyway need a database call to verify the user's status, we have **re-created some kind of HTTP session**.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

But Isn't That an HTTP Session?

- ▶ It can easily be argued, as was done previously, that since we now anyway need a database call to verify the user's status, we have **re-created some kind of HTTP session**.
- ▶ **“Sure, but now we can ...”**, see the discussion on REST authentication above.

 - ▶ That is how the browser will load for example **images and javascript files** that shall be executed on the client.
- ▶ Delivering static files is **part of express**, no extra package is needed.
 - ▶ To make express deliver files in the directory **public**, include the statement below.

```
app.use(express.static('public'));
```
 - ▶ Note that **public** is now the root directory for the server's static files. An HTTP get request for **/abc/def.png** will make the server look for the file **public/abc/def.png**

The File Structure

The server's root directory contains three things.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

The File Structure

The server's root directory contains three things.

- ▶ The directory **public**, which contains all **static files**.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

The File Structure

The server's root directory contains three things.

- ▶ The directory **public**, which contains all [static files](#).
- ▶ The directory **src**, which contains the JavaScript [source code](#).

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

The File Structure

The server's root directory contains three things.

- ▶ The directory **public**, which contains all **static files**.
- ▶ The directory **src**, which contains the JavaScript **source code**.
- ▶ All **configuration files**

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

The File Structure

The server's root directory contains three things.

- ▶ The directory **public**, which contains all **static files**.
- ▶ The directory **src**, which contains the JavaScript **source code**.
- ▶ All **configuration files**
 - ▶ **.env** and **.env.example** for settings used in our own code

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

The File Structure

The server's root directory contains three things.

- ▶ The directory **public**, which contains all **static files**.
- ▶ The directory **src**, which contains the JavaScript **source code**.
- ▶ All **configuration files**
 - ▶ **.env** and **.env.example** for settings used in our own code
 - ▶ **package.json** and **package-lock.json** for settings needed by npm.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

The File Structure

The server's root directory contains three things.

- ▶ The directory **public**, which contains all **static files**.
- ▶ The directory **src**, which contains the JavaScript **source code**.
- ▶ All **configuration files**
 - ▶ **.env** and **.env.example** for settings used in our own code
 - ▶ **package.json** and **package-lock.json** for settings needed by npm.
 - ▶ It might be a better structure to place config files in a **separate directory**, **config**, but it is not obvious how to make npm look for **package.json** in another directory.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

Layers

- ▶ The **layer structure** exists only in terms of directories, since there is no concept of grouping (like packages in Java).

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

Layers

- ▶ The **layer structure** exists only in terms of directories, since there is no concept of grouping (like packages in Java).
- ▶ There are the following layers.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

Layers

- ▶ The **layer structure** exists only in terms of directories, since there is no concept of grouping (like packages in Java).
- ▶ There are the following layers.
 - ▶ **Api** corresponds to an MVC view. It is not really a view, since no user interaction is handled by a REST API, but it handles requests and responses from the client.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

Layers

- ▶ The **layer structure** exists only in terms of directories, since there is no concept of grouping (like packages in Java).
- ▶ There are the following layers.
 - ▶ **Api** corresponds to an MVC view. It is not really a view, since no user interaction is handled by a REST API, but it handles requests and responses from the client.
 - ▶ **Controller** is a typical MVC controller.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

Layers

More “packages”

- ▶ Besides the layers mentioned above, there are also the following source code directories.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

More “packages”

- ▶ Besides the layers mentioned above, there are also the following source code directories.
 - ▶ The api layer contains the [auth](#) directory, which contains code related to authentication.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

More “packages”

- ▶ Besides the layers mentioned above, there are also the following source code directories.
 - ▶ The api layer contains the `auth` directory, which contains code related to authentication.
 - ▶ The only class in `auth` is `Authorization`, which forms a procedural api (no state, only static methods).

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

More “packages”

- ▶ Besides the layers mentioned above, there are also the following source code directories.
 - ▶ The api layer contains the `auth` directory, which contains code related to authentication.
 - ▶ The only class in `auth` is `Authorization`, which forms a procedural api (no state, only static methods).
 - ▶ `util`, containing general utility classes, which in this case means only `Logger`.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

More “packages”

- ▶ Besides the layers mentioned above, there are also the following source code directories.
 - ▶ The `api` layer contains the `auth` directory, which contains code related to authentication.
 - ▶ The only class in `auth` is `Authorization`, which forms a procedural api (no state, only static methods).
 - ▶ `util`, containing general utility classes, which in this case means only `Logger`.
 - ▶ It is convention to place the file `server`, which starts the entire application, directly in the source code root, which is `src` in this application.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

The DAO Pattern

- ▶ The responsibility of a Database Access Object, DAO is to **handle database calls**. All code related to database calls shall be in a DAO.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

The DAO Pattern

- ▶ The responsibility of a Database Access Object, DAO is to **handle database calls**. All code related to database calls shall be in a DAO.
- ▶ A DAO shall be located in the **integration layer**.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

The DAO Pattern

- ▶ The responsibility of a Database Access Object, DAO is to **handle database calls**. All code related to database calls shall be in a DAO.
- ▶ A DAO shall be located in the **integration layer**.
- ▶ It shall **not call any other layer**, except the **data** layer, but can of course use DTOs.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

The DAO Pattern

- ▶ The responsibility of a Database Access Object, DAO is to **handle database calls**. All code related to database calls shall be in a DAO.
- ▶ A DAO shall be located in the **integration layer**.
- ▶ It shall **not call any other layer**, except the **data** layer, but can of course use DTOs.
- ▶ It shall **not contain business logic**.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

The DAO Pattern

- ▶ The responsibility of a Database Access Object, DAO is to **handle database calls**. All code related to database calls shall be in a DAO.
- ▶ A DAO shall be located in the **integration layer**.
- ▶ It shall **not call any other layer**, except the **data** layer, but can of course use DTOs.
- ▶ It shall **not contain business logic**.
- ▶ Its public interface meets the needs of client objects in controller and model, and is independent of the database.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

DAO Example

```
class ChatDAO {  
  findUserByUsername(username) {  
    // Database-related code.  
  }  
  
  findUserById(id) {  
    // Database-related code.  
  }  
  
  updateUser(user) {  
    // Database-related code.  
  }  
  
  createMsg(msg, author) {  
    // Database-related code.  
  }  
  
  findAllNotDeletedMsgs() {  
    // Database-related code.  
  }  
  
  deleteMsg(id) {  
    // Database-related code.  
  }  
}
```

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

Benefits of the DAO Pattern

- ▶ DAO provides **high cohesion** since all database access code is collected in the DAO, instead of being mixed with other code.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

Benefits of the DAO Pattern

- ▶ DAO provides **high cohesion** since all database access code is collected in the DAO, instead of being mixed with other code.
- ▶ DAO provides **encapsulation** since no object outside the DAO will know the design of the database or database calls.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

Benefits of the DAO Pattern

- ▶ DAO provides **high cohesion** since all database access code is collected in the DAO, instead of being mixed with other code.
- ▶ DAO provides **encapsulation** since no object outside the DAO will know the design of the database or database calls.
- ▶ It **decouples other layers from the database**, since the public interface of the DAO is adapted to the need of other layers, not to the database.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

Classes or no Classes?

- ▶ Since JavaScript is not fully Object-Oriented, there is the question to what extent classes shall be used.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

Classes or no Classes?

- ▶ Since JavaScript is not fully Object-Oriented, there is the question to what extent classes shall be used.
- ▶ For clarity, **try to be consistent**. Use either classes, function objects, or no objects at all. Try not to mix.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

Classes or no Classes?

- ▶ Since JavaScript is not fully Object-Oriented, there is the question to what extent classes shall be used.
- ▶ For clarity, **try to be consistent**. Use either classes, function objects, or no objects at all. Try not to mix.
- ▶ The sample application is an effort to use **classes as much as possible**, at almost any cost.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

Classes or no Classes?

- ▶ Since JavaScript is not fully Object-Oriented, there is the question to what extent classes shall be used.
- ▶ For clarity, **try to be consistent**. Use either classes, function objects, or no objects at all. Try not to mix.
- ▶ The sample application is an effort to use **classes as much as possible**, at almost any cost.
 - ▶ Increases cohesion and, only to some extent since class support is poor, reduces coupling and improves encapsulation.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

Classes or no Classes?, Cont'd

- ▶ Create **one file for each class**, to improve readability and cohesion.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

Classes or no Classes?, Cont'd

- ▶ Create **one file for each class**, to improve readability and cohesion.
- ▶ Where classes can not be used, it is still important that **all code in the same file together performs only one task**, which must have high cohesion.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

The Startup Script

- ▶ All layers except **api** and the startup script, **server**, are quite straight-forward with only classes.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

The Startup Script

- ▶ All layers except **api** and the startup script, **server**, are quite straight-forward with only classes.
- ▶ Some files require a bit more explanation. The first is **server**, whose task is to **start the application**.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

The Startup Script

- ▶ All layers except **api** and the startup script, **server**, are quite straight-forward with only classes.
- ▶ Some files require a bit more explanation. The first is **server**, whose task is to **start the application**.
 - ▶ Since a JavaScript program can not start executing in a method, the startup code in **server** is just a script executing from top to bottom.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

The Startup Script

- ▶ All layers except **api** and the startup script, **server**, are quite straight-forward with only classes.
- ▶ Some files require a bit more explanation. The first is **server**, whose task is to **start the application**.
 - ▶ Since a JavaScript program can not start executing in a method, the startup code in **server** is just a script executing from top to bottom.
 - ▶ Just like the **main** method in a Java program, it shall be **as short as possible**.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

The Startup Script

- ▶ All layers except **api** and the startup script, **server**, are quite straight-forward with only classes.
- ▶ Some files require a bit more explanation. The first is **server**, whose task is to **start the application**.
 - ▶ Since a JavaScript program can not start executing in a method, the startup code in **server** is just a script executing from top to bottom.
 - ▶ Just like the **main** method in a Java program, it shall be **as short as possible**.
 - ▶ It **loads** all required packages and all endpoints in the REST API.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

The Startup Script

- ▶ All layers except **api** and the startup script, **server**, are quite straight-forward with only classes.
- ▶ Some files require a bit more explanation. The first is **server**, whose task is to **start the application**.
 - ▶ Since a JavaScript program can not start executing in a method, the startup code in **server** is just a script executing from top to bottom.
 - ▶ Just like the **main** method in a Java program, it shall be **as short as possible**.
 - ▶ It **loads** all required packages and all endpoints in the REST API.
 - ▶ When loading is done, it **makes the server listen for requests**.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

Request Handlers

- ▶ It is not possible to route an HTTP request to a method in a class, but only to a function outside a class.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

Request Handlers

- ▶ It is not possible to route an HTTP request to a method in a class, but only to a function outside a class.
- ▶ In order to still use the advantages of classes in the api layer, **MsgApi** and **UserApi** are classes with a method, **registerHandlers**, which defines the anonymous request handling functions.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

Request Handlers

- ▶ It is not possible to route an HTTP request to a method in a class, but only to a function outside a class.
- ▶ In order to still use the advantages of classes in the api layer, **MsgApi** and **UserApi** are classes with a method, **registerHandlers**, which defines the anonymous request handling functions.
- ▶ Next question is, who calls **registerHandlers** in all api classes? It is not the task of **server** to know the internals of the **api** layer.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

Request Handlers, Cont'd

- ▶ To encapsulate the request handling classes (**MsgApi** and **UserApi**), the file **index** is created in **api**.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

Request Handlers, Cont'd

- ▶ To encapsulate the request handling classes (**MsgApi** and **UserApi**), the file **index** is created in **api**.
- ▶ Note that, with the statement below, **server** requires the **api** directory, not any class in that directory.

```
const reqHandlerLoader = require('./api');
```

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

Request Handlers, Cont'd

- ▶ To encapsulate the request handling classes (**MsgApi** and **UserApi**), the file **index** is created in **api**.
- ▶ Note that, with the statement below, **server** requires the **api** directory, not any class in that directory.

```
const reqHandlerLoader = require('./api');
```

- ▶ Requiring a directory means that the **index.js** file in that directory is executed.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

Request Handlers, Cont'd

- ▶ **index** defines a class, **RequestHandlerLoader**, whose task is to call **registerHandlers** in all classes defining request handling functions.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

Request Handlers, Cont'd

- ▶ `index` defines a class, `RequestHandlerLoader`, whose task is to call `registerHandlers` in all classes defining request handling functions.
- ▶ In the sample app, `MsgApi` and `UserApi` are passed explicitly to `RequestHandlerLoader`, with the statements below.

```
const loader = new RequestHandlerLoader();  
loader.addRequestHandler(new UserApi());  
loader.addRequestHandler(new MsgApi());
```

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)

Request Handlers, Cont'd

- ▶ **index** defines a class, **RequestHandlerLoader**, whose task is to call **registerHandlers** in all classes defining request handling functions.
- ▶ In the sample app, **MsgApi** and **UserApi** are passed explicitly to **RequestHandlerLoader**, with the statements below.

```
const loader = new RequestHandlerLoader();  
loader.addRequestHandler(new UserApi());  
loader.addRequestHandler(new MsgApi());
```

- ▶ The code would be more flexible, but slightly more complicated, if **RequestHandlerLoader** instead listed all classes in the **api** directory, and assumed that for example all classes with names ending in **Api** contained request handling functions.

[CSR](#)[A REST API](#)[Express.js](#)[Cookies](#)[HTTP Sessions](#)[Authentication](#)[Scopes](#)[Other Npm Packages](#)[Architecture](#)
